SUBJECT INDEX

Alternative formulation of the boundary element method, 97
Analysis of stress wave propagation in slender bars using a discrete particle approach, 185
Approximate numerical model for radiation problems, 192
Assessment of the boundary integral equation method for in-plane elastostatic problems, 245
BIEM, Treatment of singularities in 2-D domains using, 111
Biot's linear consolidation, Boundary element method in, 105
Burgers' equation and the Moltz problem, a node-moving algorithm with application to, 464
Burgers' equation with a large Reynolds number, solution of, 380
Boundary and finite elements, a numerical study of two-dimensional potential flows by, 291
Boundary and finite elements, on the numerical solution of constrained variation problems by, 424
Boundary element formulation for elastoplastic analysis of axisymmetric bodies, 130
Boundary element formulation for geometrically nonlinear elastostatics, 136
Boundary elements to steady and unsteady potential flow problems in two and three dimensions, the application of, 35
Boundary element method, an alternative formulation, 97
Boundary element method and wave equation, 205
Boundary element method applied to linear viscoelastic analysis, 285
The boundary element method applied to plates, 237
Boundary element method for transient problems governed by the scalar wave equation, formulation of the, 307
Boundary element method for two-dimensional transient scalar wave propagation problems, Numerical implementation of the, 299
Boundary element method in Biot's linear consolidation, 105
Boundary element method in shock wave analysis, 313
Boundary element method, Numerical prediction of wave forces using the, 218
Boundary element method, some aspects of the, 229
Boundary element method, the coupling of the finite difference method and the, 233
Boundary elements, a new approach to free vibration analysis using, 000
Boundary integral equation method for in-plane elastostatic problems, an assessment of the, 245
Boundary integral equation method to the computation of plane free surface flows, the application of the, 69
C^1-collation and continuity requirements, 78
Computer performance modelling: an overview, 74
Computing the three-dimensional flow in a stratified sea using the Galerkin method, 347
Constrained variation problems by boundary and finite elements, on the numerical solution of, 291
Coupling of the finite difference method and the boundary element method, 233
Crack analysis for an anisotropic body, three-dimensional, 373
Deflection analysis of a heated elastic plate by the boundary element method, an approximate finite, 23
Demand for energy by electric utilities, 322
Determination of two dominant eigenvalues, 398
Diffusion processes described by generalized random walks, a model of coupled, 385
Digital ensemble generation, an overview of technique for, 49
Diurnal temperature variations of an object in an outdoor environment, 410
Domestic crude oil resource appraisal, 119
Dynamic method for unconstrained minimization, a new and, 449
Dynamic set covering problem, 2
Economic growth, an entropy model of environmental pollution and, 431
Eigen values, determination of two dominant, 398
Elastic fibre pull-out from a fixed and flat surface: asymptotic and numerical results, 257
Elastic half space, point and circular loads applied within a cross anisotropic, 262
Elastic half space, strip and line loads applied within an orthrhombic, 273
Elastic-plastic structures by nonlinear programming, system identification for yield units and hardening moduli in discrete, 000
Elastoplastic analysis of axisymmetric bodies, Boundary element formulation for, 130
Elasto-plasticity with a mixed finite element, Modelling of laminate structures in, 100
Elastostatic problems, an assessment of the boundary integral equation for in-plane, 245
Elastostatics, Boundary element formulation for geometrically nonlinear, 136
Elastostatics, Fundamental solutions for the collation method in planar, 389
Electric utilities, the demand for energy by, 322
Electromagnetic forces in high field magnet coils, 157
Environmental pollution and economic growth, an entropy model of, 431
Environment, on missiles modelling, simulation and evaluation in presence of noise and multi-source, 343
Extrapolation of Padé approximants in the closed-loop simulation of human thermoregulation, 81
Finite difference method and the boundary element method, the coupling of the, 233
Finite differences on the ICL distributed array processor, a note on using, 393
Finite element, Modelling of laminate structures in elasto-plasticity with a mixed finite element, 100
Finite element method, Some details of the Galerkin, 165
Finite elements, a numerical study of two-dimensional potential flows by boundary and, 291

Finite elements, a numerical study of two-dimensional potential flows by boundary and, 291
Finite elements, on the numerical solution of constrained variation problems by boundary and, 424
Flight of a supersonic aircraft, Optimum three-dimensional, 124
Flow analysis using a hybrid numerical model, Three-dimensional non-Darcy, 151
Flow in a stratified sea using the Galerkin method on computing the three-dimensional, 347
Flow in constricted axi-symmetric tubes, numerical simulation of pulsatile, 63
Flow simulation in process control, 179
Flow separation pattern: a comparison, the application of the FEM and FDM to, 28
Fluid flow model of gas agitated reactors, A turbulent, 470
Formulation of the boundary element method for transient problems governed by the scalar wave equation, 307
Fundamental solutions for the collation method in planar elastostatics, 389
Galerkin method, on computing the three-dimensional flow in a stratified sea using the, 347
Gas agitated reactors, a turbulent fluid flow model of, 470
Generalization of the radiation stress tensor, 146
Human thermoregulation, The extrapolation of Padé approximants in the closed-loop simulation of, 81
Identification and model reduction of multivariable continuous systems via a block-pulse functions scheme, 368
Impedance boundary condition, 404
Infinite elements, some useful techniques for the testing of, 436
Laminate structures in elasto-plasticity with a mixed finite element, Modelling of, 100
Magnet coils, Electromagnetic forces in high field, 157
Magnetic fields at power frequency, on the possibility of linemen's protection against, 57
Magnet windings, modelling of the stress distribution in superconducting, 75
Management systems using the GMDH method, identification and forecasting in, 7
Manufacturing process, a model for locating repair stations in a sequential, 363
Mathematical model of the load and stress statistics of vehicle structures, 92
Minimization, a new dynamic method for unconstrained, 449
Modelling, Computer performance: an overview, 74
Modelling of laminate structures in elasto-plasticity with a mixed finite element, 100
Model for locating repair stations in a sequential manufacturing process, 363
Model for radiation problems, An approximate numerical, 192
Model of coupled diffusion processes described by generalized random walks, 385
Model of the flow of mush-ice, a non-Newtonian, 331
Moltz problem, a node-moving algorithm with application to Burgers' equation and the, 464
Moment model for telephone traffic, 415
Mush-ice, a non-Newtonian model of the flow of, 331
Missiles modelling, simulation and evaluation in presence of noise and multi-source environment, 343
New and dynamic method for unconstrained minimization, 449
New approach to free vibration analysis using boundary elements, 000
Node-moving algorithm with application to Burgers' equation and the Moltz problem, 464
Non-Newtonian model of the flow of mush-ice, 331
Nonlinear programming, system identification for yield units and hardening moduli in discrete elastic-plastic structures by, 000
Nonlinear theory of flood wave propagation, 338
Note on stability of some parametrically excited structural elastic systems, 202
Note on using finite differences on the ICL distributed array processor, 393
Numerical implementation of the boundary element method for two-dimensional transient scalar wave propagation problems, 299
Numerical model, Three-dimensional non-Darcy flow analysis using a hybrid, 151
Numerical prediction of wave forces using the boundary element method, 218
Numerical solution of constrained variation problems by boundary and finite elements, 424
Numerical study of two-dimensional potential flows by boundary and finite elements, 291
Optimal RC networks for walls, 402
Optimization of a triangle net, 396
Optimization procedure based on analytic stability conditions for systems linearized by the describing function method, 16
Optimum three-dimensional flight of a supersonic aircraft, 124
Padé approximants in the closed-loop simulation of human thermoregulation, the extrapolation of, 41
Padé approximants in the closed-loop simulation of human thermoregulation, The extrapolation of, 81
Plates, the boundary element method applied to, 237
Point and circular loads applied within a cross anisotropic elastic half space, 262
Polynomials, Software for testing stability, 209
Prismatic bar of rectangular cross-section, Torsion of a composite viscoelastic, 197
Problems in nonhomogeneous media, 161
Process control, Flow simulation in, 179
Radiation problems, An approximate numerical model for, 192
Radiation stress tensor, A generalization of the, 146
Reliability of structural systems with correlated elements, 171
Resource appraisal, Domestic crude oil, 119
Shock wave analysis, the boundary element method in, 313
Simulation and evaluation in presence of noise and multi-source environment, on missiles modelling, 343
Singularities in 2-D domains using BIEM, Treatment of, 111
Software for testing stability polynomials, 209
Solution of Burgers' equation with a large Reynolds number, 380
Some aspects of the boundary element method, 229
Some details of the Galerkin finite element method, 165
Some useful techniques for the testing of infinite elements, 449
Strip and line loads applied within an orthorhomic elastic half space, 273
Structural elastic systems, A note on stability of some parametrically excited, 202
System identification for yield units and hardening moduli in discrete elastic-plastic structures by nonlinear programming, 441
Systems with correlated elements, Reliability of structural, 171
Telephone traffic, one moment model for, 415
Temperature variations of an object in an outdoor environment, the diurnal, 410
Torsion of a composite viscoelastic prismatic bar of rectangular cross-section, 197
Three-dimensional crack analysis for an anisotropic body, 373
Three-dimensional non-Darcy flow analysis using a hybrid numerical model, 151
Treatment of singularities in 2-D domains using BIEM, 111
Triangle net, optimization of a, 396
Turbulent fluid flow model of gas agitated reactors, 470
Vehicle structures, Mathematical model of the load and stress statistics of, 92
Viscoelastic analysis, Boundary element method applied to linear, 285
Wave equation, Boundary element method and, 205
Wave equation, formulation of the boundary element method for transient problems governed by the scalar, 307
Wave propagation, a nonlinear theory of flood, 338
Wave propagation in slender bars using a discrete particle approach, An analysis of stress, 185
Wave propagation problems, numerical implementation of the boundary element method for two-dimensional transient scalar, 299
